FUNCTION: PLATELET-DERIVED GROWTH FACTOR IS A POTENT MITOGEN FOR CELLS OF MESENCHYMAL ORIGIN. BINDING OF THIS GROWTH FACTOR TO ITS AFFINITY RECEPTOR ELICITS A VARIETY OF CELLULAR RESPONSES. IT IS RELEASED BY PLATELETS UPON WOUNDING AND PLAYS AN IMPORTANT ROLE IN STIMULATING ADJACENT CELLS TO GROW AND THEREBY HEAL THE WOUND. SUBUNIT: ANTIPARALLEL DISULFIDE-LINKED DIMER OF MONIDENTICAL (A AND B) CHAINS. HOMODIMERS OF A AND B CHAINS ARE IMPLICATED IN TRANSFORMATION PROCESSES.

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Tabular output not generated. Run on: Thu Nov 26 00:00:38 1998; MasPar time 3.45 Seconds 148.181 Million cell updates/sec

Title:

Description: Perfect Score: Sequence: >US-09-033-662-2 (69-82) from US09033662.pep 121

1 PSCVTVQRCGGCCP 14

Scoring table: PAM 150 Gap 11

Searched: 120441 seqs, 36531193 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

pir56 1:pir1 2:pir2 3:pir3 4:pir4 5:nrl3d

Statistics: Mean 23.485; Variance 43.203; scale 0.544

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

NIT The receptor for this growth factor is a tyrosine kinase.

Human platelet-derived growth factor, a potent mitogen for cells comesenchymal origin, is a disulfide-linked dimer of two chains, which may be both of type A, both of type B, or an A-B which may be both of type A, both of type B, or an behalf of the compact of the disulfide bonds irreversibly destroys biological activity. Different receptors bind preferentially to A-A and B-B homodimers. This growth factor induces a variety of cellular responses.

NIT B and A chains are encoded by genes located on different chromosomes. The two genes are expressed independently in human timer call line.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ##cross-references GDB:120709; OMIM:190040

Statistics: Mean 17.247; Variance 67.281; scale 0.256

Pred. d. No. is the number of results predicted by chance to have a re greater than or equal to the score of the result being printed, is derived by analysis of the total score distribution.

          Claim 14; Page 48; 113pp; English.

Splice variants (W00726-28) of the human vascular endothelial growth factor-like polypeptide SOM175 (see also W00725) are products of cDNA clones (see also SOM175 (see also T33510). They show at least 1 of the SOM175 gene (see also T33510). They show at least 1 of the properties of SOM175 including the ability to induce proliferation of vascular endothelial cells, to interact with fit-1/fik-1 receptors, and to induce cell migration, cell survival and/or an increase in intracellular levels of alkaline phosphatase. Recombinant SOM175 proteins can be used to induce astroglial proliferation and to promote neural survival and/or proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Vascular endothelial growth Vascular endothelial growth astroglial proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 W00728 standard; Protein; 101

                                                                                                                                                                                                                                                                                                          В
                                                                                                                                                                                                                                                                                                                                                                                                                       PT vascular endothelial growth factor VEGF-B proteins - useful to PT accelerate angiogenesis in wound healing, also related nucleic acid PT and antibodies for cancer diagnosis

CC and 18; Page 53-54; 107pp; English.

CC W04824-W04831 represent the vascular endothelial growth factor (VEGF)

CC proteins of the invention, which promote endothelial or mesodermal cell

CC proliferation. VEGF is also a glycosylated cationic dimer, and is

CC diverse effects, depending on the specific biological context in which it

CC cis found. VEGF is also a glycosylated cationic dimer, and is

CC diverse effects, depending on the specific biological context in which it

CC cis found. VEGF is also a glycosylated can directly

CC contributes to induction of angiogenesis in vivo by promoting endothelial

CC cil growth during normal embryonic development, wound healing, and

CC tissue regeneration/reorganisation. The VEGF proteins of the invention

CC share the angiogenic and other properties of VEGF, but are distributed

CC and expressed in tissues differently to VEGF. The proteins can therefore

CC be used to accelerate angiogenesis in wound healing. Antibodies can

CC complementary to the coding sequences for the proteins can therefore

CC complementary to the coding sequences for the proteins of the invention

CC can also be used diagnostically to quantitatively detect VEGF-B. Primers

CC complementary to the coding sequences for the proteins of the invention

CC metastatic risk. VEGF-B expression in a cell can be retarded using

CC antisense sequences direct against the VEGF coding sequences, this is

CC especially useful in retarding VEGF expression in tumour cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Š

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC proteins of the invention, which promote endothelial or mesodermal cell convertins of the invention, which promote endothelial or mesodermal cell convertins of the invention, which promote endothelial or mesodermal cell converting the protein of the specific biological context in the collection of the specific biological context in the collection of angiogenesis in vivo by promoting endothelial cell mitogen, and directly contributes to induction of angiogenesis in vivo by promoting endothelial cell growth during normal embryonic development, wound healing, and contributed the angiogenic and other properties of VEGF, but are distributed the angiogenic and other properties of VEGF, but are distributed and expressed in tissues differently to VEGF, but are distributed to used to accelerate angiogenesis in wound healing. Antibodies can the proteins can be used for inhibiting angiogenesis. The antibodies can also be used to detect VEGF-B coding sequences. Quantification of VEGF-B in cancer biopsy specimens may be useful as an indicator of complementary to the coding sequences for the proteins of the invention can also be used to detect VEGF-B coding sequences. Quantification of CC wetastatic risk. VEGF-B expression in a cell can be retarded using cantisense sequences direct against the VEGF coding sequences, this is cancer before a complementary to the coding sequences of the invention of CC expression in retarding VEGF expression in tumour cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                         CC W04834-W04831 represent the vascular endothelial growth factor (VEGF) CC proteins of the invention, which promote endothelial or mesodermal cell proteins of the invention, which promote endothelial or mesodermal cell consistency of the invention, which promote endothelial or mesodermal cell proteins referred to as vascular permeability factor (VPF). VEGF has cliverse effects, depending on the specific biological context in which it is found. VEGF is a potent endothelial cell mitogen, and directly contributes to induction of angiogenesis in vivo by promoting endothelial cell growth during normal embryonic development, wound healing, and crissue regeneration/reorganisation. The VEGF proteins of the invention constant the angiogenesis in very but are distributed and expressed in tissues differently to VEGF. The proteins can therefore be used to accelerate angiogenesis in wound healing. Antibodies against the proteins can be used for inhibiting angiogenesis. The antibodies can complementary to the coding sequences for the proteins of the invention complementary to the coding sequences for the proteins of the invention complementary to the coding sequences for the proteins of the invention can also be used to detect VEGF-B coding sequences. Quantification of VEGF-B in cancer biopsy specimens may be useful as an indicator of complements used to detect VEGF-B coding sequences, changing antibodies can the sequences direct against the VEGF coding sequences, this is especially useful in retarding VEGF expression in tumour cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   factor-like polypeptide SOM175 (see also W00725) are products of cDNA clones (see also T33611-13) respectively lacking exon 6, exons 6+7, and exon 4 of the SOM175 gene (see also T33610). They show at least 1 of the properties of SOM175 including the ability to induce proliferation of vascular endothelial cells, to interact with flt-l/flk-l receptors, and to induce cell migration, cell survival and/or an increase in intracellular levels of alkaline phosphatase. Recombinant SOM175 proteins can be used to induce astroglial proliferation and to promote neural survival and/or proliferation. Sequence 143 AA;

WRF167 (W00863) is the murine homologue of an alternatively spliced variant (W00726) of human vascular endothelial growth factor-like polypeptide SOM175 (W00725), a protein capable of inducing astroglial proliferation and of promoting neural survival and/or proliferation. Its amino acid sequence was deduced from a CDNA clone (T13810) isolated from a new-born mouse brain CDNA library. WRF167 shows 85% identity and 92% similarity to its human counterpart. It lacks 101 amino acids found in WRF186 (W00863), the murine homologue of SOM175, owing to a deletion of exon 6 during splicing.

Sequence 188 AA;

        PT accelerate angiogenesis in wound healing, also related nucleic acid
PT and antibodies for cancer diagnosis
Claim 18; Page 55-56; 107pp; English.
CC W04824-W04831 represent the vascular endothelial growth factor (VEGF)
CC proteins of the invention, which promote endothelial or mesodermal cell
CC proteins of the invention, which promote endothelial or mesodermal cell
CC proteins of the invention, which promote endothelial or mesodermal cell
CC proteins of the invention, which promote endothelial or mesodermal cell
CC contributes to induction of angiogenesis in vivo by promoting endothelial
CC cil growth during normal embryonic development, wound healing, and
CC cil growth during normal embryonic development, wound healing, and
CC cil growth during normal embryonic development, wound healing, and
CC cil growth during normal embryonic development, wound healing, and
CC cil growth during normal embryonic development, wound healing, and
CC cil growth during normal embryonic development, wound healing, and
CC cil growth during normal embryonic development, wound healing, and
CC cil growth during normal embryonic development, wound healing, and
CC constributes of the proteins of the invention
CC and expressed in tissues differently to VEGF. The proteins can therefore
CC the proteins can be used for inhibiting angiogenesis. The antibodies against
CC complementary to the coding sequences for the proteins of the invention
CC can also be used diagnostically to quantitatively detect VEGF-B. Primers
CC complementary to the coding sequences. Quantification of
CC metastatic risk. VEGF-B expression in a cell can be retarded using
CC especially useful in retarding VEGF expression in tumour cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

Splice variants (W00726-28) of the human vascular endothelial growth factor-like polypeptide SOM175 (see also W00725) are products of cDNA clones (see also T33611-13) respectively lacking exon 6, exons 6+7, and exon 4 of the SOM175 gene (see also T33610). They show at least 1 of the properties of SOM175 including the ability to induce proliferation of vascular endothelial cells, to interact with fit-1/fik-1 receptors, and to induce cell migration, cell survival and/or an increase in intracellular levels of alkaline phosphatase. Recombinant SOM175 proteins can be used to induce astroglial proliferation and to promote neural survival and/or proliferation.

                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PT accelerate envolueries in wound healing, also related nucleic acid
PT and antibodies for cancer diagnosis
Claim 18; Page 56-57; 107pp; Enjalish.
CC W04824-W04831 represent the vascular endothelial growth factor (VEGF)
CC proteins of the invention, which promote endothelial or mesodermal cell
CC proteins of the invention, which promote endothelial or mesodermal cell
CC proteins of the invention, which promote endothelial or mesodermal cell
CC proteins of the invention, which promote endothelial or mesodermal cell
CC gometimes referred to as vascular permeability factor (VPF). VEGF has
CC diverse effects, depending on the specific biological context in which it
CC is found. VEGF is a potent endothelial cell mitogen, and directly
CC contributes to induction of angiogenesis in vivo by promoting endothelial
CC tissue regeneration/reorganisation. The VEGF proteins of the invention
CC share the angiogenic and other properties of VEGF, but are distributed
CC cell growth during normal embryonic development, wound healing, and
CC the used to accelerate angiogenesis in wound healing. Antibodies can the proteins can be used for inhibiting angiogenesis. The antibodies can
CC the proteins can be used for inhibiting angiogenesis. The antibodies can
CC use be used diagnostically to quantitatively detect VEGF-B. Primers
CC complementary to the coding sequences for the proteins of the invention
CC can also be used to detect VEGF-B coding sequences. Quantification of
CC metastatic risk. VEGF-B expression in a cell can be retarded using
CC especially useful in retarding VEGF expression in tumour cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Š

              Human vascular endothelial growth factor (VEGF)-like polypeptide (W00725) is capable inducing the proliferation of vascular endothelial cells, of interacting with flt-1/fkl-1 receptors, and of inducing cell migration, cell survival and/or an increase in intracellular levels of alkaline phosphatase. It shows 33.3% identity with human VEGF (see also W00724). Splice variants (W00726-28) of SCM175 have also been identified. Recombinant SOM175 can be produced in host cells transformed with vectors carrying SOM175 cDNA (see also T33610). It is useful for inducing astroglial proliferation and for promoting neural survival and/or proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              library.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Example 5; Fig 9: 113pp; English.

VRF186 (W00863) is the murine homologue of human vascular endothel growth factor-like polypeptide SOM175 (W00725), a protein capable inducing astroglial proliferation and of promoting neural survival and/or proliferation. Its amino acid sequence was deduced from a cDNA clone (T13809) isolated from a new-born mouse brain cDNA
                                                                                                                                                                                                                                                                                             N-PSDB; T33610.

                                                                                                                                                                                                                                                       PT vascular endothelial growth factor VEGF-B proteins - useful to PT accelerate anglogenesis in wound healing, also related nucleic acid PT and antibodies for cancer diagnosis

SC Claim 18; Page 62; 10/pp; English.

CC W04824-W04831 represent the vascular endothelial growth factor (VEGF) CC proteins of the invention, which promote endothelial or mesodermal cell CC proliferation. VEGF is also a glycosylated cationic dimer, and is CC contents of the invention of the specific biological context in which it is found. VEGF is a potent endothelial cell mitogen, and directly CC cell growth during normal embryonic development, wound healing, and circular tissue regeneration/reorganisation. The VEGF proteins of the invention CC cell growth during normal embryonic development, wound healing, and circular the angiogenic and other properties of VEGF, but are distributed and expressed in tissues differently to VEGF. The proteins can therefore the used to accelerate anglogenesis in wound healing. Antibodies can camplementary to the coding sequences for the proteins of the invention CC complementary to the coding sequences for the proteins of the invention can also be used to detect VEGF-B coding sequences. Quantitication of C VEGF-B in cancer biopsy specimens may be useful as an indicator of C C metastatic risk. VEGF-B expression in a cell can be retarded using CC expecially useful in retarding VEGF expression in tumour cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Š

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC sometimes referred to as vascular permeability factor (VPF). VEGF has CC diverse effects, depending on the specific biological context in which it CC is found. VEGF is a potent endothelial cell mitogen, and directly CC contributes to induction of angiogenesis in vivo by promoting endothelial CC cell growth during normal embryonic development, wound healing, and CC tissue regeneration/reorganisation. The VEGF proteins of the invention CC share the angiogenic and other properties of VEGF, but are distributed CC and expressed in tissues differently to VEGF. The proteins can therefore be used to accelerate angiogenesis in wound healing. Antibodies can the proteins can be used for inhibiting angiogenesis. The antibodies can also be used diagnostically to quantitatively detect VEGF-B. Primers CC complementary to the coding sequences for the proteins of the invention CC complementary to the coding sequences for the proteins of the invention CC vEGF-B in cancer biopsy specimens may be useful as an indicator of metastatic risk. VEGF-B expression in a cell can be retarded using antisense sequences direct against the VEGF coding sequences, this is concerned. 207 AA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         develop prods. for, e.g. stimulating angiogenesis or treating tumours, inflammation or rheumatoid arthritis Claim 11; Page 44; 56pp; English.

This sequence is that of human vascular endothelial growth factor 3 (YEGF3). The growth factor can be used to stimulate angiogenesis and wound healing, and to promote vascular tissue repair. It can also be used to induce the growth of damaged bone, periodontium or ligament tissue. VEGF3 antagonists can be used to inhibit tumour growth, or to treat diabetic retinopathy, inflammation, rheumatoid arthritis or psoriasis. VEGF3 is structurally related to the PDGF/VEGF family and it includes the conserved signature motif for the family (see features table).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

gland tissue from a lactating female, and was then primed with a Not I - oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo. "
